## Avidity ELISA

Created by: Vanessa Walraven

## Aim

To quantify the avidity of a polyclonal antiserum to a specific antigen using sodiumthiocyanate (NaSCN). The avidity-index is the NaSCN-concentration at which $50 \%$ of the bound antibodies is eluted off.

## Materials

ө Deepwell plates: TreffLab \#96.8564.9.01
ө ELISA-plates: Greiner Bio-one \#655092
ө Plastic seals: Nunc \#236266
ө Platereader: Bio-Rad Model 680 Microplate Reader
ө Platewasher: ELx405 Auto Plate Washer
$\theta \quad$ PBS pH 7.4: Gibco \#10010-015
$\theta$ BSA (Bovine Serum Albumine) Fraction V, $\geq 96 \%$; Sigma \#9647
$\theta$ Tween-20: Merck \#8.22184.0500
$\theta$ Blockingbuffer (BB): PBS $+0.05 \% \mathrm{v} / \mathrm{v}$ Tween $-20+3 \% \mathrm{w} / \mathrm{v}$ BSA
e.g. for $500 \mathrm{ml} \mathrm{BB}: 500 \mathrm{ml}$ PBS $+250 \mu \mathrm{l}$ Tween $-20+15 \mathrm{~g}$ BSA
$\theta$ Coatingbuffer (CB): PBS
$\theta$ Dilutionbuffer (DB): PBS $+0.05 \% \mathrm{v} / \mathrm{v}$ Tween $-20+0.5 \% \mathrm{w} / \mathrm{v}$ BSA
e.g. 500 ml PBS $+250 \mu \mathrm{l}$ Tween $-20+3 \mathrm{~g}$ BSA
$\theta$ NaSCN (Sodium thiocyanate); Fulka \#71938; M=81.07
Make a stock-solution of 6 M NaSCN (e.g. 97.28 g NaSCN in 200 ml PBS ) and make the required concentrations out of this stock. Commonly used range: 0M $0,25 \mathrm{M}-0,5 \mathrm{M}-0,75 \mathrm{M}-1 \mathrm{M}-1,25 \mathrm{M}-1,5 \mathrm{M}-1,75 \mathrm{M}-2 \mathrm{M}-2,25 \mathrm{M}-2,5 \mathrm{M}-3 \mathrm{M}$.
$\theta \quad \mathrm{MgCl}_{2} * 6 \mathrm{H}_{2} \mathrm{O}$ : (magnesium chloride hexahydrate) Merck \#1.05833.0250;
M=203.30
$\theta$ Diethanolamine: Merck \#803116; M=105.14
$\theta$ DEA-buffer: $500 \mathrm{ml} \mathrm{MQ}+492 \mu$ Diethanolamine $\mathrm{pH} 9.8+0.15 \% \mathrm{w} / \mathrm{v} \mathrm{MgCl}_{2} * 6$ $\mathrm{H}_{2} \mathrm{O}$ (e.g. 0.15 g )
ө PNPP (Para Nitro Phenyl Phosphate Hexahydrate); Fluka \#71768

## Method

1. Coat ELISA-plates with the desired coating. Coating diluted in $\mathrm{CB}, 100 \mu \mathrm{l} / \mathrm{well}$. Incubate $o / n$ at $4^{\circ} \mathrm{C}$, covered with a plastic seal or a lid.
2. Prepare samples and standards in deepwell plates. Dilute samples in DB, make $100 \mu 1 /$ well at a concentration of 1 AU . Incubate o/n at $4^{\circ} \mathrm{C}$.
3. Remove coating from plates by inverting the plates with a vigorous wrist action.
4. Block the plates with $200 \mu \mathrm{l} / \mathrm{well} \mathrm{BB}$, incubate 1 h at RT.
5. Wash with platewasher program 9 .
6. Add $100 \mu \mathrm{l}$ /well of sample at 1 AU. Add $100 \mu \mathrm{l} /$ well DB for the standard.
7. Add $100 \mu \mathrm{l}$ of standard and dilute it 2 -fold over 11 wells. Leave the Blank blank. Incubate 1 h at RT.
8. Wash with platewasher program 9 .
9. Add $100 \mu \mathrm{l} /$ well NaSCN in different concentrations to the wells with samples.

For the wells with standard or blank just add DB. Incubate 15 min at RT.
10. Wash with platewasher program 9.
11. Add $100 \mu \mathrm{l} /$ well conjugated antibody diluted in DB. Incubate 1 h at RT.
12. Wash with platewasher program 9.
13. Add $100 \mu \mathrm{l} / \mathrm{well} \operatorname{PnPP}(1 \mathrm{mg} / \mathrm{ml})$ in DEA-buffer. Incubate 30 min at RT.
14. Read OD at 450 nm on the platereader.
15. Export data as csv-file.
16. Calculate results using ADAMSEL.

Schematic:

| Action | Material | Supplier | Concentration/ Dilution | Dilute in | Incubate |

## Results

Calculate results using ADAMSEL.
In the sheet "Samples All" you find all the OD-values and calculated concentrations of the samples. To a new sheet you copy the following columns: "Name sample", "Conc1" and "Conc2" (Conc1 and Conc2 are the duplicates). Per sample the upper concentration is $100 \%$ bound.
In this new sheet, in the next column (next to the columns you just copied), you make 2 new columns " $\% 1$ " and "\%2". In these new columns you calculate the percentage remaining bound antibodies as: (Conc $\mathrm{x} /$ Conc 100)*100. You do this for both duplicates.
Then you make the next column "av\%", where you take the average of the calculated percentages. And in the next column you put the [NaSCN].
Then you make a graph, on the x -axis the [ NaSCN ] and on the y -axis the percentage bound.
Within this graph you add the smaller line of just to 2 adjacent concentrations and percanteges around $50 \%$ (so in the example $59.4 \%$ at 0.75 M and $49.3 \%$ at 1 M ), and from this line you add the trendline. Choose the option "Display equation on chart" as you add the trendline.
Next to the graph you copy this equation (in this example the equation is $y=-40.244 x$ +89.54 ). To calculate ' $x$ ' you then put in ' $y=50$ ' (the formula will now become "(89.54-50)/40.244" resulting in " 0.98 "). In the formula ' $x$ ' is the the avidity-index.
